

Comparing Language Attitudes Toward Arabic in New York City With Those In Egypt

NSF REU SITE: Intersection of Linguistics, Language, and Culture

Marwa Elraey, CUNY Brooklyn College

INTRODUCTION

Accent

A distinctive way of pronunciation due to difference in social class, cultural/ethnic group, and/or place of growing up.

Dialect

A different variety of a language with differences in grammar, vocabulary, and/or pronunciation.

Diglossia

Refers to cases where two language varieties are spoken within the same speech community but in different domains (settings/situations).

e.g.

- High and Swiss German
- Standard and Cypriot Greek
- French and Haitian Creole
- Arabic dialects and Standard Arabic (SA)

SIGNIFICANCE

- More need to study differences between Arabic dialects on one hand and differences between Arabic dialects and Standard Arabic (SA) on the other.
- Low motivation to learn the standard variety as it is significantly different from the spoken dialects. Some linguists attribute this oral-literacy gap to Diglossia (Abu-Rabia, 2000) (Ayari, 1996).
- Another possible consequence is poor reading and writing skills which may transfer to L2 causing poor attainment.

PREVIOUS STUDY

Husein (2017) study investigated the attitudes Egyptian college students have toward SA → Egyptian students' attitudes toward SA

3 Domains tested

Affective Domain

Reflects feelings, preferences, likes.

Behavioral Domain

Reflects intentions and plans.

Cognitive Domain

Reflects beliefs and opinions.

Results

- Positive Cognitive and Behavioral attitudes toward SA
- Negative Affective attitudes.

RESEARCH QUESTIONS

1. What do Arabic speakers think about the two varieties/diglossia?

2. Would we expect similar results among Arabic speakers in NYC?

PRESENT STUDY

Methodology

- Setting: Mosque in NYC; majority of attendees are Arabs, especially Egyptians.
- Questionnaire was filled out both online and on paper.
- Dörnyei (2010): questionnaires are versatile.
- ~21 Demographic questions (e.g. dialect(s) spoken, age, educational level, etc.).
- 29 Questions about the participants' attitude toward both varieties..
- 6 questions asking respondents to self-evaluate their proficiency of SA and that of their dialect.
- 1 Question asking about the situations where they would use SA.

29 language-attitude-related questions:

- ~10 affective questions
- ~15 behavioral questions
- ~9 cognitive questions
- Overlap; not clear-cut

Participants

- Study in progress: so far 37 respondents, expecting more
- Most respondents regularly interact with one or more person who speaks another dialect
- 81.6% females; 18.4% males

RESULTS

1. I wish I could speak [SA] fluently (Behavioral Domain)

(Husein, 2017)

	Freq.	%	Cumul.
Strongly Disagree	1	2.0	2.0
Disagree	7	14.0	16.0
Don't Know	3	6.0	22.0
Agree	23	46.0	68.0
Strongly Agree	16	32.0	100.0
Total	50	100	

16%

78%

Present Study

2. I enjoy watching TV shows and movies in [SA] (Affective Domain)

	Freq.	%	Cumul. %
Strongly Disagree	11	22.0	22.0
Disagree	18	36.0	58.0
Don't Know	4	8.0	66.0
Agree	16	32.0	98.0
Strongly Agree	1	2.0	100.0
Total	50	100.0	

58%

34%

(Husein, 2017)

Present Study

3. It is easy to learn SA (Cognitive Domain)

Q3. It is easy to learn fuṣḥā

	Frequency	%
Strongly Disagree	7	14.0
Disagree	19	38.0
Don't Know	4	8.0
Agree	18	36.0
Strongly Agree	2	4.0
Total	50	100.0

52%

40%

(Husein, 2017)

3. For me, SA is harder than the vernacular (Cognitive Domain)

Present Study

CONCLUSIONS AND LIMITATIONS

Results

- Similarities of (behavioral and cognitive) attitudes toward diglossia among Arabic speakers in the Arab world and heritage speakers in NYC.
- Different attitudes in the affective domain.

limitations

- Investigating the reasons for Husein's negative affective attitude and for our study's positive affective attitude.
- Too many variables. Focus on one non-linguistic variable (e.g. educational level, gender, etc.).
- More participants, especially male participants.
- More questions concerning the cognitive and the affective domains.
